SCIENTIFIC BACKGROUND

Numerous studies have demonstrated that hyperhomocysteinemia (HHcy) is an independent risk factor for cardiovascular and cerebrovascular diseases and that an increase in hypertension and plasma homocysteine (Hcy) has a synergistic effect in causing these diseases. Homocysteine is an important intermediate product in the metabolism of methionine and cysteine. The enzymes 5,10-methylenetetrahydrofolate reductase (MTHFR) and cystathionine β -synthetase (CBS) are key enzymes in homocysteine metabolic pathways. The catalytic activity of the MTHFR enzyme creates an irreversible reduction of 5,10-methylenetetrahydrofolate (THF) which is converted to 5-methyl-THF during this process. 5-methyl-THF is the most abundant circulating form of folic acid, serving as a methyl donor for the remethylation of homocysteine to methionine, a reaction (catalyzed by methionine synthase) for which vitamin B12 is required. The cystathionine β -synthetase (CBS) gene is located on chromosome 21q22.3 and codes for an enzyme that participates in the folate pathway and catalyzes the transsulfuration of homocysteine and serine to cystathionine as a precursor of cysteine.

CLINICAL SIGNIFICANCE

The CBS gene has many mutations and polymorphisms.

The 844ins68 polymorphism at position 844 in the CBS gene generates an alternative splice site that disrupts the protein, resulting in decreased functional activity of CBS. The deficiency of this enzyme causes an increase in homocysteine in the blood and homocystinuria.

Furthermore, the T833C mutation generating a restriction site of BsrI (CBS I278T) has been shown to segregate in cis with the 844ins68 polymorphism in exon 8.

Significant interactions were observed between the polymorphisms of MTHFR C677T, MTHFR A1298C and the CBS 844ins68/T833C haplotype for Hcy levels. In fact, heterozygotes show higher homocysteine values.

Interactions between the various polymorphisms may therefore influence serum Hcy levels, where multiple heterozygosity could be a risk factor for vaso-occlusive episodes.

The 844ins68 polymorphism has also been associated with other diseases, including neural tube defects and cancer.
